The Tool: Graphical Analysis is a professional solution designed to create and print graphs, while also offering a bunch of other features such as dedicated tools to calculate tangents and integrals. Although it's such an advanced program, the interface is the ace up its sleeve, as everything's being made quite straightforward and easy to use. It takes a while to get used to it, but Graphical Analysis is equipped with powerful features to create and print graphs, histograms and data tables straight from the main window. You can even insert tables and additional graphs, ovals and rectangles to better organize information in the main graph, parameter controls and text annotations. The "Analyze" menu is the one that will come in handy to most of the users because it lets you calculate integrals, tangents, statistics and interpolations, allowing you to easily work with graph data. Last but not least, Graphical Analysis can also work with external devices, including TI graphing calculators, as long as they are connected to the computer with either a TI-GRAPH LINK cable or USB cables. Thus, you can import data in just a few minutes, as long as you manage to set up the connection. It does sound like a professional job, but a detailed help file is also part of the package, just to make sure you can easily take the most out of the app. Graphical Analysis needs a reasonable amount of computer resources and works pretty smooth on all Windows versions without stressing up the CPU and RAM. Advertisement Your MTron The first thing you should know about your MTron is that it has a lot going on. It's made up of individual cells, called cluster cells, that are clamped together. It has a 16 bit battery pack that contains the charge of the whole system. It has a heater, an internal circuitry, and a chain. The first thing you must know about your system is that any type of system damage that could affect the performance of your system will occur in these 4 components. For instance, a heater that has overheated may be damaged and render the system inoperative until it's cleaned up. Processing The cell processing is where your power source is transformed from one type to another. For instance, your battery converts DC to AC and finally your AC unit uses the power to convert it to DC. This transformation ensures that the power is usable in the cell. Chains These are long cells that are stitched together to keep the particle flow. Your cells in the battery pack don't touch each other directly and if they did, it would hinder the flow of electricity. The cell cluster fits into a hole that's slightly larger than the cell itself. The hole is placed onto a chain. Heating Every cell in a cluster cell chain has a heater attached. The heater keeps the cell from getting too cold and slows down the flow of electrons. This is done
