**Netapp Oncommand System Manager 2.2 Download!**

---

in a previous post i shared my vmware environment requirements. it is important to understand these as they give you a good idea as to what vmware environment will work with your virtual appliance. i will highlight the vmware requirements for my environment below: netapp oncommand system manager is a consolidation tool, which aims to simplify management, integration and monitoring of oncommand and netapp fabric-attached storage. it was developed to optimize workflows for storage administrators and increase efficiency. pilot organizations in 2011, netapp announced their intentions to deliver an integrated product roadmap that will accommodate the changing needs of storage customers. after collaborating with the storage community for several months, the company launched netapp oncommand system manager . multiple logical volumes oncommand can be managed on the same physical volume. netapp recommends that you set up each logical volume individually. otherwise, both applications might use the same volume names to manage data. oncommand application version the unified manager access token (uam-autn) is identical to the web authentication token (wat) contained in the authorization parameter. the wat is contained in a html form, which includes the url parameter. 2 cluster history.. 5 acknowledgments this document was produced by the owasp appsec testing project . this document is a part of the series titled "owasp testing guide for web applications and web services". this series is made available by the open web application security project (owasp) as a free, open book and seeks to provide detailed and unbiased information on how to identify and correct security flaws in web applications. 5ec8ef588b
