Detecting the illumination characteristics of a specimen is an important task in confocal microscopy. This paper presents a new and simple method for detecting non-uniform illumination in confocal microscopy. The new method is based on the properties of the reflected speckle pattern of a homogeneous specimen. When the speckle pattern of a homogeneous specimen is viewed via a pinhole the maxima of the images coincide, and the image position can be calculated easily. When an inhomogeneous specimen is viewed the maxima of the images do not coincide, and the position is calculated by an iterative algorithm. Results show that the system is capable of detecting the illumination non-uniformity of specimens with various speckle patterns.1. Field of the Invention The present invention relates to gas supply sources, and more specifically to a gas supply source with a shutting-off function. 2. Description of the Related Art The conventional gas supply sources are comprised of a gas tank and a pipe. The pipe is communicated with the outside, and a gas is filled in the gas tank. The gas tank is connected to the pipe by tightening with a screw. In the case that a gas tank is connected to the pipe, the gas tank is sometimes sealed by the screw, thus leakage of the gas in the case that the screw is loosened. The present invention has been disclosed to solve the above-mentioned problem and includes a gas tank communicated with the outside, and a gas pipe communicated with the outside, wherein at least one thread is provided on a part of a screw connected to the gas

Este es el primer ejemplo de la transferencia de calor y masa. Sin embargo, este tipo de transferencia es muy difícil de determinar porque los destinatarios de calor son muy diferentes del origen. Por ejemplo, el origen puede ser combustible caliente (condensación caliente) y el destino puede ser combustible frío (condensación fría). El combustible frío se enfría y se transforma en energía caliente. Para determinar 79a2804d6b
